

Abstract

5 The invention provides a food processing device designed for a purpose to give a more convenient barbeque, which can fulfil the functions of easily refuelling , effectively adjusting the distance between the charcoal grate and the grilled food in the process of grilling, and directly
10 cleaning up the ash at the end of cooking. The fire chamber of the barbeque is a built-in drawer equipped with the coal grate. A window is built in the front of the barbeque body, into which the said drawer fire chamber is inserted. Meanwhile an elevating device, connected to the charcoal grate and fire chamber, is mounted on the coal grate in the drawer.
